

# Trigonometry with right triangles

# Security

A security camera in a neighborhood bank is mounted on a wall 9 feet above the floor. What angle of depression should be used if the camera is to be directed to a spot 6 feet above the floor and 12 feet from the wall?

1. Let's find the hypotenuse  $b$  with the **Pythagorean theorem**:

$$b^2 = a^2 + c^2 = 12^2 + 3^2 = 144 + 9 = 153$$

$$b = 12.37$$

2. Use the **Second theorem on Right triangles** to find the angle of depression:

$$a = c * \tan \gamma \quad \longrightarrow \quad \tan \gamma = \frac{a}{c} = \frac{3}{12} = \frac{1}{4}$$

# Angle of depression

$$\tan^{-1} \frac{1}{4}$$

$$\gamma = 14^\circ$$

## Height of a Mountain

In travelling across flat land, you notice a mountain directly in front of you. Its angle of elevation (to the peak) is  $3.5^\circ$  miles closer to the mountain. The angle of elevation is  $9^\circ$ . Approximate the height of the mountain.

$$1. \beta = 180^\circ - 9^\circ = 171^\circ$$

$$\alpha = 180^\circ - 171^\circ - 3,5^\circ = 5,5^\circ$$

2. Let's use the **Law of Sines** to find the side  $c$

$$c = \frac{a}{\sin \alpha} * \sin \gamma = \frac{13}{\sin 5,5} * \sin 3,5 = 8.28 \text{ mi}$$

3. Let's consider the **right triangle with hypotenuse  $c$**

$$\alpha' = 180^\circ - 90^\circ - 9^\circ = 81^\circ$$

4. With the First Theorem on Right Triangles we can find the height of the mountain ( $h$ )

$$h = c * \cos \alpha' = 1.295 \text{ mi}$$

The height of the mountain is 1.295 miles
